MediClaim AI - Sample Medical Policy Document

Synthetic test document for PDF upload, text extraction, chunking and RAG question answering. This document does not contain real patient data and is safe for portfolio testing.

1. Policy Overview

This sample policy describes a fictional medical insurance plan called MediCare Basic Plus. The policy is designed to support outpatient consultations, diagnostic imaging, physiotherapy, emergency treatment and selected specialist services. Coverage depends on eligibility, documentation, treatment category and policy limits.

2. Covered Services

Service	Coverage Rule	Limit
General consultation	Covered when provided by a registered clinic or approved medical professional.	Up to EUR 150 per visit
Diagnostic imaging	Covered for X-ray, ultrasound and MRI when clinically justified.	Up to EUR 1,000 per claim
Physiotherapy	Covered after referral from a doctor or specialist.	Up to 8 sessions per policy year
Emergency care	Covered for urgent and medically necessary treatment.	Subject to review
Prescription medication	Covered when linked to an approved diagnosis and supported by receipt.	Up to EUR 300 per claim

3. Dental Treatment

Routine dental cleaning is not covered under this policy. Dental treatment is covered only when it is directly linked to an accident, emergency trauma, or medically required procedure. Cosmetic dental treatment, whitening, veneers and elective orthodontic treatment are excluded. High-value dental claims should be manually reviewed against the accident report, clinical notes and invoice details.

4. Required Claim Documents

A valid claim must include the claim form, invoice or receipt, treatment date, provider name, diagnosis or reason for treatment, and any referral letter where applicable. Diagnostic imaging claims should include clinical justification. Emergency claims should include treatment notes or discharge summary.

5. Exclusions

This policy excludes cosmetic procedures, experimental treatments, non-medically necessary services, duplicate claims, claims submitted after the allowed submission period, and services provided by unregistered or unapproved providers. Claims with missing evidence may be rejected or sent for manual review.

6. Risk Indicators for Manual Review

The following conditions may trigger additional review: duplicate claim numbers, unusually high claim amounts, repeated claims for the same patient and procedure, dental claims above EUR 700, claims without required documents, treatment outside policy coverage and provider details that do not match approved clinic records.

7. Example RAG Questions

- What treatments are covered by the policy?

- Are dental procedures included?

- What documents are required for claim review?

- What exclusions are listed?

- Why might a dental claim be flagged for manual review?

Additional Notes for Testing

This second page gives extra text so that the application can create multiple chunks during text extraction. The policy language is intentionally simple and repetitive so that it is easy to test source-grounded question answering in a RAG workflow.

If a claim amount is higher than normal for the procedure code, the claim should not be automatically rejected. Instead, it should be marked for review and explained to the human reviewer. The goal of MediClaim AI is to support decision-making, not replace final human judgement.

For example, an MRI claim for EUR 900 may be normal if supported by referral and clinical justification. A duplicate claim number, however, should be reviewed because it may indicate accidental resubmission or possible duplicate billing. Dental claims require extra checks because many routine or cosmetic dental services are excluded.

The system should provide clear explanations, source references, and suggested next steps. It should avoid making direct fraud accusations. Risk levels are only decision-support signals.
